## Deformation under tensile load

Reaction Force

$$
F_{R} \longleftrightarrow F_{A}
$$

Applied Force

Deformation under compressive load

Reaction Force
$F_{R}$
$\longrightarrow$ $\begin{gathered}\text { Applied Force } \\ F_{A}\end{gathered}$

General case: $\quad F_{R} \propto \delta^{n}$

$$
\Rightarrow F_{R}=k \delta^{n}
$$

$k$ : Spring Constant (a measure of stiffness of the spring)

Special case: $n=1$
$\Rightarrow F_{R}=k \delta \quad \rightarrow$ Hooke's law (linear spring)

From Newton's $2^{\text {nd }}$ Law of motion,

$$
F_{R}-F_{A}=\text { (mass)(acceleration) }
$$

When acceleration is absent and/or mass is negligible,

$$
k \delta^{n}-F_{A}=0
$$

Or, $F_{A}=k \delta^{n}$

## Force vs. Deformation curve

$$
\text { Slope of curve }=k=\frac{h}{b} \rightarrow \text { measure of stiffness of the material }
$$

Linear elasticity $\Rightarrow$ Constant slopes
Example: Most materials under small deformation relative to undeformed configuration

Change in length, $\delta$

## Force vs. Deformation curves for Linear and Nonlinear Elasticity

## Example of Activity 2

(Controlled extension of rubber band)

| Loading sequence number, n | Mass (kg) | Reading from ruler, $Y$ (metre) | Extension, $\mathrm{d}=\mathrm{Y}-\mathrm{Y}_{0}$ (metre) | Force = Mass*9.81 (newton) |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | $Y_{0}$ | 0 | 0 |
| 1 |  |  |  |  |
| 2 |  |  |  |  |
| 3 |  |  |  |  |
| 4 |  |  |  |  |
| 5 |  |  |  |  |
| 6 |  |  |  |  |
| 7 |  |  |  |  |
| 8 |  |  |  |  |
| 9 |  |  |  |  |
| 10 |  |  |  |  |
| 11 |  |  |  |  |
| 12 |  |  |  |  |
| 13 |  |  |  |  |

| Loading sequence number, n | Mass (kg) | Reading from ruler, $Y$ (metre) | Extension, $\mathrm{d}=\mathrm{Y}-\mathrm{Y}_{0}$ (metre) | Force = Mass*9.81 (newton) |

## Example of Activity 2: Controlled extension of rubber band

Force vs. Deformation plot for rubber band tensile test

## Example of Activity 3

(Launching match-stick using rubber-band as a projectile)

Force vs. Deformation plot for rubber band tensile test

Potential energy stored in the rubber band for extension of $z$ metre (area under the Force vs. Deformation curve from $d=0$ up to $z$ metre)

## Total elastic potential energy stored = area under Force vs. Deformation curve

Change in length, $\delta$

Change in length, $\delta$

| $\#$ | Range, R <br> (metre) |
| :---: | :---: |
| 1 |  |
| 2 |  |
| 3 |  |
| 4 |  |
| 5 |  |
| Median |  |

## Kinetic energy of projectile at launch when rubber band is released

Assuming: (1) Projectile launched horizontally, and (2) No air resistance,

Kinetic energy of projectile $=($ Mass of projectile $)(\text { Horizontal velocity of projectile at launch })^{2} / 2$
$(\text { Horizontal velocity of projectile at launch })^{2}=\frac{(\text { Range of projectile })^{2}(\text { Acceleration due to gravity) }}{2(\text { Elevation of launch point) }}$

$$
\frac{\text { Kinetic Energy of Projectile at launch }}{\text { Potential Energy stored in Rubber Band }}
$$

## Activity 3: Launching a match-stick using the rubber-band as a projectile

- Range, R (median of range values from 5 repetitions of projectile launch)
- Elevation of launch, $H$
- Acceleration due to gravity, $g=9.81 \mathrm{~m} / \mathrm{sec}^{2}$
- Mass of projectile, M
- Velocity of launch of projectile, $\mathrm{v}=\mathrm{R} \sqrt{g / 2 H}$
- Kinetic energy of projectile at launch, $\mathrm{KE}^{(\mathrm{Pr})}=\mathrm{Mv}^{2} / 2$
- Potential energy stored in rubber-band for z metre of extension, $\mathrm{PE}^{(\mathrm{Rb})}$ in Joule
- Ratio $=\mathbf{K E}^{(\mathbf{P r})} / \mathbf{P E}{ }^{(\mathrm{Rb})}=$ ?
